"Soil is sold during season from spring until below zero temperatures"

A New Life for Biowaste

Mustankorkea's own products are high quality soils. In the production we utilize our biowaste and refinery sludge composts.

Our own soil products

Omapiha planting soil

Usage: gardens, flowerbeds, planting boxes
– also suitable for vegetable gardens

Omapiha planting soil is a compost fertilized and calcified soil product containing ground materials. It is sieved to a grain size of 0-25 mm. You don't need to fertilize or calcify the product during the planting stage, because the compost gives a long-term fertilizing effect. Nurture fertilization is still needed in the future. During the planting stage it is important to remember plentiful watering. Recycling materials have been used in the production of the product.

Omapiha lawn soil

Usage: growth basis for lawn

Omapiha lawn soil is a compost fertilized and calcified soil product containing ground materials. It is sieved to a grain size of 25 mm. You don't have to fertilize or calcify Omapiha lawn soil during the planting stage, because the compost gives a sufficient fertilizing effect. In the future nurture fertilizing is still needed. Recycling materials have been used in the production of the product.
